Electronic flat roof leak detection in a set € 2999.- Netto

An extension of the FDO systems from Lümme!

On a dry flat roof/pool, you systematically drive over the area with the Lu-Jumta Mobil s1 and are informed of leaks through a tone signal and an additional color change of the LED from the suspended Main Module TX 4.7P. The roll is wet and thus makes contact with the ground by rolling over the leakage! Signal!!! The Main Module TX 4.7 P is suspended. The yellow socket is connected to the ground via a long cable (earth area, protective contact cable drum, etc.). Red is connected from the Jumta Mobil s1 to the red socket on the Main Module. A voltage of 48 volts is more than sufficient to find the path from the Main Module through the leakage to the ground. No sparking can damage the foils here. We use the gentle method for the safe localization of holes.

- Main Modul TX 4.7 P in the cable operation Including cable accessories
- Lu-Jumta Mobil s1 Driving on the surfaces of flat roofs and pools!
- Modul S2 Checking corners!
- Modul S3 Checking bolts on flanges!
