Electronic POOL Leak Detection Set

€ 1999.- Netto

Link to Video

An extension of the FDO systems from Lümmen!
You systematically scan the inner surface of a dry pool with the Mobil S2 and are notified of leaks by the attached Lu-FDO 4.7jun with a tone signal and additional LED color change.
The module is wet and thus makes contact with the house ground by crossing over the leak! Signal!!!
The Lu-FDO 4.7jun is reattached. The yellow socket is connected to the house ground via a long cable (ground rod, protective contact cable reel, etc.).
The red connection is for Module S1, S2, or S3.
A voltage of 48 volts is completely sufficient to find the path from the Lu-FDO 4.7jun over the leak to the house ground. No sparks can form that might damage the foil.
We use the gentle method for safe localization of holes.
